

RECYCLING LINE

INFORMATION

A typical example of what can be done with the minimal handling of the waste. Simply introduce the waste into the shredder, this gives the primary breakdown of the waste which is then extracted by the refiner fan to give a secondary breakdown which reduces and refines to give a consistent size particle suitable for briquetting. These particles are then blown straight into the briquette hopper with the air filtered and dispersed via the optional mini filter mounted directly on top of the briquetting machine.
